Module: CST2572 Secure Web Technologies
Assessment 1: Case Study / Scenario

Context:

A client calls you first thing on a Saturday morning, panicking as their website has been hacked. The website is for a major national health conference with NHS as a leading promotor. Other details:

- The server had auto-malware checks on it which shut the site down
- The server is an Apache server setup in a VM by a host
- The setup also contains the company's main health website with a member's database
- All websites are designed and running WordPress
- There is admin access via a username/password
- The web developers have declared that what has happened is 'out of their remit'

Describe:

How do you initially reconnaissance and discover what has occurred?
How do you remedy?
How do you clean-up and restore?
Mitigate?

Ensure you provide diagrams of the system and any upgrades or updates that are needed.
